

Exercise IV

Maia Arrais Mateo: I like the aesthetic of the project. I found the color style very appealing because of its relation to the main topic of inspiration. Since this schedule was for a Pilates class, I found that the beige and white that were predominantly implemented into the visualization were very fitting. I think it is very compelling to use an everyday life experience as inspiration for this project. Also, I like the fact that the page has all the necessary features for both the user and the instructor. The user can see and get information about the classes as well as cancel or book an appointment, which is very useful. I think the page is well organized and the visualization is clean and easy to navigate. I believe this project has the potential to be applied to future applications, such as a mobile phone app or integration with calendar reminders.

Junming He and Tianshun Wu: When I first looked at this project, I was very surprised by the movement and interaction of the page. There were boxes being highlighted simultaneously, all together showcasing different sounds. Since this topic was related to Max/MSP, I was very surprised by the potential of implementing the logic from Max/MSP in a simpler way. This application allows the user to choose their own sequence of sounds, customize the settings, and save the sounds to gather into a visual collection. The user interface is very simple and easy to understand; we can follow what we need to click to create a certain action. What impressed me most is the quality of the code. As a first impression, I thought that the code would be long and contain many elements, but it is very well organized and clear.

Ethan Armstrong: I think this project's implementation was interesting. I like the way that the information is presented. The option to choose between things by having only two options is engaging. The layout of the user interface is well organized and easy to follow. I like that the color style is simple, and the boxes highlight when an answer is chosen. Another thing that I found interesting was the visualization at the end showing the percentages of all the responses collectively. It is nice to have a collective view of what other users have in common. Also, I think this idea can be developed further since it has a strong base to build upon. It is simple but effectively conveys what it is intended to project.
