

Sophie Sanchez
Project 2

Written Description

This project was created with the intention of gathering data from the user in an engaging way. This short interactive game was made to collect information such as the user's name, birth month, and a personal question. The collected data is stored and used for the next step, the reading phase. During this phase, the user receives a random card with a message responding to their question. There are a total of 8 cards, each with a unique name and custom message that is randomly selected for the user.

The main goal of the game is to store user data in a meaningful way. I wanted the user to experience the feeling of receiving a random message that could spark positivity in their day. By asking a question, the user is invited to reflect on something meaningful to them, even though the response is generated randomly. What matters most is that no matter what question is asked, the user always receives a positive message that can have a good impact on their day. I find it interesting that, even when we know the message is generated by a system, we still feel a sense of belief or curiosity by wondering if the message carries a deeper meaning or connection to what we asked. The intended outcome was to create a page that stores user information in a thoughtful way. I wanted users to have the option to hide their question if it felt too personal, while still displaying other details on the homepage. Additionally, I planned to include images that represent each of the messages, making the experience more visually engaging.

I also wanted to display multiple messages; I plan to add more in the future to create more personalized responses. Furthermore, I would like to add animations so that the cards move dynamically rather than appearing static. My main reference for this project was the tarot reading experience. I wanted to bring that type of interaction into my project, inspired by the feeling of drawing a random card and receiving a message that resonates with a personal question. I also drew inspiration from tarot and horoscopes, particularly the idea of connecting the experience to a person's birth month.
